SYSTEMS AND PROCEDURES JOURNAL

ANNUAL INDEX

January–February

8 **An Application Of Work Design In An Oil Company**
The conventional approach to systems design in this instance required 2500 man-hours with no resultant savings; the work design approach required only 900 man-hours with savings of more than $1 million.
Gerald Nadler

13 **Education For Systems Analysis: Part I**
How to train analysts to utilize the potential of modern computers is the big problem in today's data processing. This article suggests the methods by which this can be accomplished.
Frank Greenwood

16 **Solving Problems Creatively**
We should school ourselves to alternate between the hot faucet of pure ideas and the cold faucet of judgment. At any point, we can decide to "sleep on it."
M. O. Edwards

26 **EDP Personnel Should Communicate Too**
"As the use of computers increases and EDP systems grow in complexity, the need for improved communication among human beings is every bit as vital as the need for improved communication among computers."
Alfred S. Sharlip

28 **Improved Forecasting Based On Sales History**
Here is a special moving average technique for use in forecasting established items for inventory control. It is responsive to significant changes in sales, yet remains stable in the fact of random fluctuations.
W. H. Hoffmann

32 **Planning For Management by Objectives**
Plans must be made for where we want to go and how we want to get there. This approach brings planning down to a practical, understandable level.
John J. Simpkins

March–April

8 **What Is Completed Staff Action?**
It involves no less than these functions: anticipation, judgment, coordination, analysis, evaluation, summary, reconsideration and explanation.
Thomas P. Murphy

12 **New Role For The Wholesaler**
The wholesaler must act quickly to protect his own competitive position and that of his customers by extending his services to include EDP.
James Hugon, Robert Schmelzlee

14 **Flowcharting: Shorthand, Analysis And Model**
Charting can be a revealing, adaptable means of pinning down clearly what is happening in terms of many dimensions.
W. W. Martin

28 **Decision Tables For Better Management Systems**
They force a clear statement of the problem and compel the analyst to consider all the logical alternatives.
John A. H. Shober

34 **Supporting A Weapons System With IDP**
It assists management in controlling support services by issuing spares data to facilitate the concurrent delivery of equipment and spares.
Gustav J. Bujovsky

38 **Education For Systems Analysis: Part II**
A curriculum for educating persons interested in working in this field and a related short course for retraining are proposed.
George J. Brabb

May–June

10 **Put Corporate Information And Data Automation In Perspective**
There is a definite need within each company for focused attention on information needs. Such needs go well beyond the capabilities of current data automation equipment.
Halbert G. Cooper, Jr.

16 **Congruency: Driving Force Of Management Systems**
"Each management system has a rationale inseparable from other systems and inseparable from the context of business activity. This need for congruency extends down to the least subsystem of management."
Arthur L. Svenson

27 **How To Evaluate Wide Area Telephone Service**
This widely publicized but little understood communications service should be scrutinized carefully. Two procedures are "musts": a breakdown of cost by minute; and an analysis of their frequency and dispersion.
Jules Levin

30 **On-Going Management Systems With Operations Research**
Marginal analysis concepts underlie nearly all OR studies leading to least-cost or maximum profit operations. Here is a detailed example of the linear programming technique for determining opportunity costs associated with changes in raw materials and distribution capability.
Granville R. Gargiulo

38 **By People Or By Procedures**
Production control techniques merely shorten the time gap between knowledge of a defect in output and time at which the error was made. They do not improve quality nor reduce the number of defects. Thus, we must again focus attention on the key to production efficiency: the worker.
Richard A. Kaimann

40 **Let's Broaden Computer Specialists**
Application of hardware to a broader spectrum of problems has left the computer specialist behind. Here's what must be done to assure that more people carry a broad enough overview of how specific problems relate to other activities.
Fred M. Heddinger

July–August

8 **Human Factors And The Machine Age**
"We must learn to realize that even in the work of automation, where tehnical emphasis and personal production are likely to dominate, we must start to measure jobs in human as well as functional needs.
Thomas P. Selby

15 **Limitations Of Predetermined Motion Time Systems**
Research into the following assumptions claimed by surveyors of PMTS is needed: that they are "scientific"; that they "work"; and that they improve industrial relations.
Bertram Gottlieb

29 **What Are The Earmarks Of Effective Total Systems?**
A study reveals that five characteristics are most often cited by systems men as being the most important elements for total systems.
C. Clifford Wendler

32 **Paperwork Is A Symptom**
Once this statement is adopted as a popular cliche, current palliative attacks by hords of specialists on paperwork alone will be ended. Attention will then be given to those matters of significance that produce unwarranted paperwork.
Herman Limberg

38 **The Magnitude Of Fixed Property And Dilemma Of Depreciation**
How much de we actually think about our fixed assets? How much of an accurate record do we keep? Do we throw it all into one account? Do we consider return on investment?
Moritz E. Pape

42 **Input Devices For Manufacturing Information Systems**
Manufacturing data collection improvements can be undertaken now, says the author, even though plans may call for future incorporation of this information in a total management information system.
Theodore O. Prenting

48 **This Point Cannot Be Overemphasized**
When the reason for the existence of an organizational unit has changed because of the introduction of new technology, the organizational structure should also be changed to reflect and facilitate the streamlining made possible by that technology.
William Heshka

September–October

10 **How To Install A Management Information And Control System**
Can such a system be installed to provide management with uniform, concise and timely information? Yes, says the author, and he presents a step-by-step method for such an installation.
Joseph I. Barnett

15 **A System Of Program Documentation**
Proper documentation will provide its user with that "extra" information required so that the user may accomplish objectives efficiently and economically.
Joseph E. Holzer

18 **The Elements Of Comprehensive Operations Analysis**
Poor manpower utilization begins when management fails to state functions to be performed; and continues when management doesn't search for improved processing methods.
Wilbur J. Fuhro

26 **Optimizing The System Design**
The optimum base for determining the validity of a system design rests on documentation of user benefits in terms of cost savings. Here are the elements of costing proposed and present systems.
H. John Koudry

30 **How Much Protection For Magnetically Recorded Data?**
Vital records safeguarding must be approached from a new viewpoint because most data is now on magnetic media instead of paper, centralized EDP causes records to be concentrated in one place, and clerical "know-how" is concentrated in sets of computer programs.
Gregory M. Dillon

34 **Striving For Excellence With Man And Machine**
Effective appraisals are mandatory in the pursuit of a sound improvement program, and these include appraisal sof personnel, hardware, software and systems.
Robert A. Albert

39 **If It Works, It's Obsolete**
We must recognize the opportunity to adopt this philosophy in our daily work to attain maximum efficiency in operations. Most operations could have been more successful had they been earlier subject to challenge and change.
Ernest L. Anderson, Jr.

41 **Let's Use PERT/Cost With Flexibility**
Although a system or technique man may enjoy the status of being generally applicable to PERT/Cost methods, its operation can only be accomplished on specific programs subject to their constraints.
Joseph V. Guida

November–December

10 **Data Processing Needs Management Standards**
Two types of standards are required: methods standards for guidance in operating the installation: and performance standards for measuring the operation. All standards should be embodied in one data processing manual for each installation.
Dick H. Brandon

14 **A System For Statistical Standards Derivation**
Each set of historical data should be subjected to the following successive steps until a standard is obtained: (1) test for average standard; (2) test for line relationship; (3) test for multiple standards; and (4) apply the standards.
Wilbur J. Fuhro

22 **Modern Systems Management And The Systems Game**
As computers have become more human, a new race, fathered by the computer technicians and mothered by the managers, has developed.
Milton C. Spett

30 **Predictability And Control Through Short Interval Scheduling**
The author first tells of a management information network that will give effective forecasting and control, accepting information from many departments having many types of SIS installations. Second, he shows how SIS was installed in one department to feed information into that management report.
Donald L. Gerber

40 **Value Analysis In The Systems World**
With much fanfare, value analysis has joined the parade of labels in use to define technique. The results achieved by it are like results that systems men are achieving by their own particular methods.
James A. Kerr

46 **Management Auditing: Guidelines For Staffing And Implementation**
Unlike members of traditional audit groups, candidates for management auditing must be experienced in the disciplines to be audited and then trained in the art of auditing.
